

MB-BackUp **an easy-to-use backup system for small companies**

Regular securing of data is one of the most important productive tasks in the IT business. Data can be permanently lost due to a malfunction, mistake, or accident.

There are several systems for managing backups; often bloated, awkward, and expensive. Multibase Oy has developed a clear and secure copy-based solution for small companies.

MB-BackUp is based on a simple operation where the desired folders of a workstation or server are automatically copied onto another computer (eg a server) at a chosen time.

Installation is simple: first, the MB-BackUp Configuration program is installed onto the computer where the backups are wished to be archived. It is used for defining which folders are taken copies of, where they are copied to and how many different "generations" are saved from the backups. After this, the actual MS-BackUp program is attached to the computer's own timer. The system is ready for use! Should an error occur, the backup events are automatically logged.

MB-BackUp is delivered as a ready-to-use package. It includes charting of backup needs, installation of the application, guidance, and introduction. The product is sold with a company license; it can be freely installed to the desired workstations within the company.
